

**Well to Wheel Zero Emissions**

Formula Zero stands for ZERO emissions, so all the needed hydrogen will be produced from renewable energy sources like wind, sun or biomass.

There are two ways of producing hydrogen in a sustainable way without producing emissions: Biomass and electrolysis with sustainable energy sources. In the kart, hydrogen is converted into electricity. No harmful emissions are released during this process. Furthermore, it is far more effective than a conventional combustion engine; even when it runs on hydrogen

*Using a 'click and go' high-pressure cartridge makes it easy and safe to refuel the kart.*

*Next to the mobile track of the travelling circus, the hydrogen will be produced from solar, wind and biomass.*

Formula Zero's zero emission racing is accredited by:
